

Small but unique

The **Speed UP** from ICARO paragliders represents a new generation of mini-paragliders (mini wings).

A small area, few main lines, rods in the leading edge, low weight and uncomplicated start and landing characteristics, agility, mobility and dynamics – All this combined in one glider.

The **Speed UP** rises reliably and continuously over the pilot without hanging or shooting over even with little or no wind. The big advantage of the small area is that it can be handled much easier in strong wind since the area cannot be attacked as much.

The **Speed UP** reacts without delay and precisely when shifting weight and reacts to steering impulses immediately. It can be flat in thermals but can also be manoeuvred very steeply into the spiral. The amazing speed which is provided offers many possibilities for example fast valley crossings when flying long distance.

The **Speed UP** offers a successful alternative amongst this type of glider on the market for light pilots since it convinces and inspires with an attractive flight performance despite its small area.

Like this our little **Speed UP** is the ideal companion not only in the mountains but also at the edge of the thermals or in the thermals at your home mountain.

Small areas with high loads are generally more dynamic and more radical during turbulences as normal gliders. Many test- and adjustment flights during all kind of different conditions finally guided us to success.

With the **Speed UP** ICARO paragliders succeeded to combine everything a pilot's heart could wish for when flying a small area with a high area load.

Test it yourself – You will be amazed!
